

## **9. CAPITAL AND PRODUCTION COST AND ECONOMIC ANALYSIS**

Capital cost, production cost, and cost-of-electricity estimates were developed for each plant based on adjusted vendor-furnished and actual cost data, and resulting in determination of a revenue requirement cost-of-electricity based on the power plant costs and assumed financing structure.

### **9.1 CAPITAL COSTS**

The capital costs at the Total Plant Cost level include equipment, materials, labor, indirect construction costs, engineering, and contingencies. Operation and maintenance cost values were determined on a first-year basis and subsequently levelized over the 20-year plant book life to form a part of the economic analysis. Quantities for major consumables such as fuel and sorbent were taken from technology-specific heat and mass balance diagrams developed for each plant application. Other consumables were evaluated on the basis of the quantity required using reference data. Operation cost was determined on the basis of the number of operators. Maintenance costs were evaluated on the basis of requirements for each major plant section. The operating and maintenance costs were then converted to unit values of \$/kW-year or ¢/kWh.

Each major component was based on a reference bottoms-up estimate, establishing a basis for subsequent comparisons and easy modification as the technology is further developed.

- Total Plant Cost, or “Overnight Construction Costs” values are expressed in January 1998 year dollars.
- Total Plant Investment values are expressed in mixed year dollars for a January 2005 commercial operation.
- The estimates represent commercial technology plants, or nth plants for the PC and NGCC and initial commercial offerings for the IGCC.
- The estimates represent a complete power plant facility, with the exception of the exclusions listed below.

- The estimate boundary limit is defined as the total plant facility within the “fence line,” including coal receiving and water supply system but terminating at the high voltage side of the main power transformers.
- Site is characterized to be located in Middletown, USA. Although not specifically sited within any region, it is based on a relative equipment/material/labor factor of 1.0 and is considered to be located on a major navigable waterway.
- Costs are grouped according to a process/system oriented code of accounts; all reasonably allocable components of a system or process are included in the specific system account in contrast to a facility, area, or commodity account structure.
- The operating and maintenance expenses and consumable costs were developed on a quantitative basis.
- Operating labor cost was determined on the basis of the number of operators required.
- Maintenance cost was evaluated on the basis of relationships of maintenance cost to initial capital cost.
- Cost of consumables, including fuel, was determined on the basis of individual rates of consumption, the unit cost of each consumable, and the plant annual operating hours.
- Byproduct credits for commodities such as gypsum and emissions are not considered due to the variable marketability. However, credit for sulfuric acid is recognized in the economic evaluations.

Each of these expenses and costs is determined on a reference year basis and escalated to a first-year basis, and subsequently levelized over the life of the plant and reported on the 10<sup>th</sup> year basis through application of a levelizing factor to determine the value that forms a part of the economic evaluation. This amount, when combined with fuel cost and capital charges, results in the figure-of-merit, COE.

The capital cost, specifically referred to as Total Plant Cost (TPC) for each power plant, was estimated for the categories consisting of bare erected cost, engineering and home office overheads, and fee plus contingencies. The TPC level of capital cost is the “overnight

construction” estimate. The capital cost was determined through the process of estimating the cost of every significant piece of equipment, component, and bulk quantity.

The capital cost is defined not only in terms of the TPC but also the categories Total Plant Investment (TPI), and Total Capital Requirement (TCR). Table 9-1 identifies the various cost elements that are included in each level of the capital cost.

**Table 9-1**  
**LEVELS OF CAPITAL COST**

Bare Erected Cost (Process Capital and Facilities) Equipment Cost Material Cost Direct Labor Cost Indirect Labor Cost
Total Plant Cost (TPC) Engineering Contingencies Process Project
Total Plant Investment (TPI) Cash Expended (Escalation) AFDC
Total Capital Requirement (TCR) Royalty Preproduction Cost Inventory Capital Initial Catalyst and Chemicals Land Cost

The reference labor cost to install the equipment and materials was estimated on the basis of labor man-hours. Labor costing was determined on a multiple contract labor basis with the labor cost including direct and indirect labor costs plus fringe benefits and allocations for contractor

expenses and markup. This was supplemented in limited cases, as required, with equipment labor relationship data to determine the labor cost.

The indirect labor cost was estimated at 7 percent of direct labor to provide the cost of construction services and facilities not provided by the individual contractors. The indirect cost represents the estimate for miscellaneous temporary facilities such as construction road and parking area construction and maintenance, installation of construction power; installation of construction water supply and general sanitary facilities, and general and miscellaneous labor services such as jobsite cleanup and construction of general safety and access items.

The TPC level of the estimate consists of the bare erected cost plus engineering and contingencies. The engineering costs represent the cost of architect/engineer (A/E) services for home office engineering, design, drafting, and project construction management services. The cost was determined at a nominal rate of 8 percent applied to the bare erected cost on an individual account basis. Any cost for engineering services provided by the equipment manufacturers and vendors is included directly in the equipment costs.

The TPC estimate summary at the major account level is shown on Table 9-2.

Consistent with conventional power plant practices, the general project contingency was added to the TPC to cover project uncertainty and the cost of any additional equipment that could result from a detailed design. This project contingency is intended to cover the uncertainty in the cost estimate itself. The contingencies represent costs that are expected to occur. Based on EPRI criterion 1, the cost estimate contains elements of Classes I, II, and III level estimates. As a result, on the basis of the EPRI guidelines, a variable rate was used to arrive at the plant nominal cost value. These values, at the stem account level, are included in Appendix E. This project contingency is intended to cover the uncertainty in the cost estimate itself. A similar approach was applied to recognize process contingency except only non-mature accounts have process contingency values. The contingencies represent costs that are expected to occur.

	<b>TOTAL PLANT COST</b>	<b>\$448,840</b>	<b>1,129</b>	<b>\$471,489</b>	<b>1,173</b>	<b>\$467,774</b>	<b>1,170</b>	<b>\$170,968</b>	<b>524</b>	<b>\$182,227</b>	<b>461</b>

In addition to the TPC cost level, the TPI and TCR were determined. TPI at date of startup includes escalation of construction costs and allowance for funds used during construction (AFDC), formerly called “interest during construction,” over the construction period. TPI is computed from the TPC, which is expressed on an “overnight” or instantaneous construction basis. For the design and construction cash flow, a variable expenditure rate was assumed, with all expenditures taking place at the end of the year.

The TCR includes all capital necessary to complete the entire project. TCR consists of TPI, prepaid royalties, preproduction (or startup) costs, inventory capital, initial chemical and catalyst charge, and land cost:

- Preproduction costs are intended to cover operator training, equipment checkout, major changes in plant equipment, extra maintenance, and inefficient use of fuel and other materials during plant startup. They are estimated as follows:
  - One month fixed operating costs -- operating and maintenance labor, administrative and support labor, and maintenance materials.
  - One month of variable operating costs at full capacity (excluding fuel) -- includes chemicals, water, and other consumable and waste disposal charges.
  - 25 percent of full capacity fuel cost for one month -- covers inefficient operation that occurs during the startup period.
  - Two percent of TPI -- covers expected changes and modifications to equipment that will be needed to bring the plant up to full capacity.
- Inventory capital is the value of inventories of fuel, other consumables, and byproducts, which are capitalized and included in the inventory capital account. The inventory capital is estimated as follows: solid fuel inventory is based on full-capacity operation for 30 days, but natural gas is excluded from inventory capital.
- Inventory of other consumables (excluding water) is normally based on full-capacity operation at the same number of days as specified for the fuel. In addition, an allowance of 1/2 percent of the TPC equipment cost is included for spare parts.

- Initial catalyst and chemical charge covers the initial cost of any catalyst or chemicals that are contained in the process equipment (but not on storage, which is covered in inventory capital). No value is shown because costs are minimal and included directly in the component equipment capital cost.
- Land cost is based on \$1,500 per acre.

The TPI and TCR values are included in the economic results table at the end of this section.

Although the estimate is intended to represent a complete power plant, there are several qualifications/exclusions as follows:

- Sales tax is not included (considered to be exempt).
- Onsite fuel transportation equipment (such as barge tug, barges, yard locomotive, bulldozers) is not included.
- Allowances for site-specific conditions (such as piling, extensive site access, excessive dewatering, extensive inclement weather) are not included.
- Switchyard (transmission plant) is not included. The scope of the cost estimate includes the high voltage terminal of the main power transformer.
- Ash disposal facility is excluded, other than the storage in the ash-storage silos. (The ash disposal cost is accounted for in the ash disposal charge as part of consumable costs.)
- Royalties are not included.

## **9.2 PRODUCTION COSTS AND EXPENSES**

The production costs or operating costs and related maintenance expenses (O&M) described in this section pertain to those charges associated with operating and maintaining the power plants over their expected life.

The costs and expenses associated with operating and maintaining the plant include:

- Operating labor

- Maintenance
  - Material
  - Labor
- Administrative and support labor
- Consumable
- Fuel cost

These costs and expenses are estimated on a reference year (January 1998) basis and then escalated to a first-year basis, in January 2005 dollars. The first-year costs assume normal operation and do not include the initial startup costs. The operating labor, maintenance material and labor, and other labor-related costs are combined and then divided into two components: fixed O&M, which is independent of power generation, and variable O&M, which is proportional to power generation. The first-year O&M cost estimate allocation is based on the plant capacity factor.

The other operating costs, consumables and fuel, are determined on a daily 100 percent operating capacity basis and adjusted to an annual plant operation basis. The inputs for each category of operating costs and expenses are identified in the succeeding subsections, along with more specific discussion of the evaluation processes.

### **9.3 COST OF ELECTRICITY (COE)**

The revenue requirement method of performing an economic analysis of a prospective power plant has been widely used in the electric utility industry. This method permits the incorporation of the various dissimilar components for a potential new plant into a single value that can be compared to various alternatives. The revenue requirement figure-of-merit is COE levelized (reported on a 10<sup>th</sup> year basis) coal pile-to-busbar cost of power expressed in ¢/kWh. The value includes the TCR, which is represented in the levelized carrying charge (sometimes referred to as the fixed charges), 10<sup>th</sup> year fixed and variable operating and maintenance costs, 10<sup>th</sup> year consumable operating costs, and the 10<sup>th</sup> year fuel cost.

The principal cost and economics output for this study, the Capital Investment and Revenue Requirement Summary, is included in Appendix E and summarized in Table 9-3. This table presents key TPC values and other significant capital costs, reference year operating costs, maintenance costs, consumables, fuel cost, and the levelized constant dollar busbar COE.
